

Cafe Sales Process Automation

iiko POS System Implementation · Business Analysis Case Study

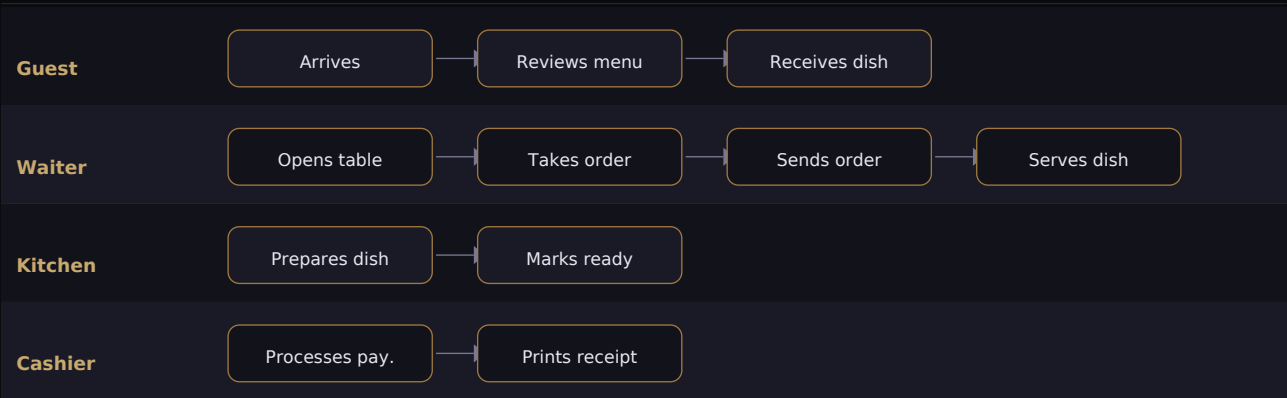

CONTEXT

A cafe (50 seats, 3 POS terminals) faced recurring issues: revenue discrepancies, slow shift closing (40+ min), order errors during peak hours. All tracking was manual.

GOAL

Automate the full sales cycle — from table opening to shift close using iiko POS, reducing human error and improving real-time visibility into revenue.

PROCESS MAP — BPMN 2.0

RESULTS

Metric	Before	After	Result
Shift closing time	40 min	10 min	▼ 75%
Revenue discrepancies	3-5/week	0	▼ 100%
Order errors	~8/day	~1/day	▼ 87%
Revenue visibility	End of day	Real-time	Live

KPI FRAMEWORK

Average check	> prev. period
Revenue / Checks	
Revenue / waiter	Growth trend
Sum of closed checks	
Cancellation rate	< 2%
Cancelled / Total items	
Shift close time	< 15 min
Last order to Z-report	

USER STORY

As a waiter,
I want to open a table in the POS and take an order, so that the kitchen receives it instantly without verbal communication, and the check is formed automatically.

PYTHON IMPLEMENTATION

iiko_analytics.py
pandas · merge · groupby · pivot_table
Computes all KPIs from iiko export data.
Validates control sums. Outputs JSON report for BPMN/API.

cancellation_worker.py
Camunda · External Task · REST API
Connects Python business logic to BPMN engine.
Fetches task, calculates rate, routes process.
