

Sales Process Automation in iiko

Cafe automation · Business Analysis · Process Modeling

Context	Goal
A cafe (50 seats, 3 POS terminals) faced recurring issues: revenue discrepancies, slow shift closing, and order errors during peak hours. Order tracking was manual, shift reports were compiled in Excel.	Automate the full sales cycle — from table opening to shift close — using iiko POS system, reducing human error and improving real-time visibility into revenue and staff performance.

Process Map (BPMN)

Solution — iiko Configuration

- **Table management:** Waiter opens table in iiko — order instantly routed to kitchen display, eliminating verbal errors
- **Menu modifiers:** Configured dish options (size, ingredients) — reduces incorrect orders
- **Payment integration:** Card terminal linked to iiko — no manual sum entry, automatic receipt printing
- **Access control:** Discounts require manager PIN — eliminates unauthorized write-offs
- **Auto Z-report:** Shift closes automatically with full breakdown by waiter, payment type, and category
- **Real-time dashboard:** Revenue, average check, and cancellations visible to manager at any moment

Results

Metric	Before	After	Result
Shift closing time	40 min	10 min	▼ 75%
Revenue discrepancies	3–5 per week	0	▼ 100%
Order errors	~8 per day	~1 per day	▼ 87%
Revenue visibility	End of day	Real-time	✓ Live

User Story

As a waiter,

I want to open a table in iiko and take an order,

so that the kitchen receives it instantly without verbal communication,

and the check is automatically formed for the guest.

KPI Framework

KPI	Formula	Target
Average check	Revenue / Number of checks	> prev. period
Revenue by waiter	Sum of closed checks per waiter	Growth trend
Cancellation rate	Cancelled items / Total items ordered	< 2%
Shift close time	Time from last order to Z-report	< 15 min
